CS32: Introduction to Computer Science II

Discussion Week 7

Junheng Hao, Arabelle Siahaan
May 17, 2019

- Project 3 is due 11PM next Tuesday, May 21. (@A@)
- Midterm 2 is scheduled next Thursday, May 23. (@_@)

Outline Today

- Template and STL (Review)
- Algorithm efficiency & Big-O notation
- Sorting
- Hints: Project 3

Template

Motivation: More generic class

- Think about the Pair class. The class should not work only with integers. That is we want a “generic” Pair class. (Well, I know you were thinking `typedef` just now~)
- Here we go: `Pair<int> p1; Pair<char> p2;`

```
class Pair {  
    public:  
        Pair();  
        Pair(int firstValue,  
              int secondValue);  
        void setFirst(int newValue);  
        void setSecond(int newValue);  
        int getFirst() const;  
        int getSecond() const;  
    private:  
        int m_first;  
        int m_second;  
};
```

```
template<typename T>  
class Pair {  
    public:  
        Pair();  
        Pair(T firstValue,  
              T secondValue);  
        void setFirst(T newValue);  
        void setSecond(T newValue);  
        T getFirst() const;  
        T getSecond() const;  
    private:  
        T m_first;  
        T m_second;  
};
```

Template

Multi-type template

- What if we need pair with different types? (One with int value while the other with string value)
- Just slightly change your template class and: `Pair<int, string> p1;`

```
template<typename T>
class Pair {
public:
    Pair();
    Pair(T firstValue,
         T secondValue);
    void setFirst(T newValue);
    void setSecond(T newValue);
    T getFirst() const;
    T getSecond() const;
private:
    T m_first;
    T m_second;
};
```

```
template<typename T, U>
class Pair {
public:
    Pair();
    Pair(T firstValue,
         U secondValue);
    void setFirst(T newValue);
    void setSecond(U newValue);
    T getFirst() const;
    U getSecond() const;
private:
    T m_first;
    U m_second;
};
```

- Member function should also be edited in template class as well.

```
void Pair::setFirst(int newValue)
{
    M_first = newValue;
}
```

```
template<typename T>
void Pair<T>::setFirst(T newValue)
{
    M_first = newValue;
}
```

- When you are not changing the values of the parameters, make them const references to avoid potential computational cost. (Pass by value for ADTs are slow.)

```
template<typename T>
T minimum(const T& a, const T& b)
{
    if (a < b)
        return a;
    else
        return b;
}
```

Template

Some notes

- Generic comparisons:
 - `bool operator>=(const ItemType& a, const ItemType& b)`
- Use the template data type (e.g. `T`) to define the type of at least one formal parameter.
- Add the prefix `template <typename T>` before the class definition itself and before each function definition outside the class. Also place the postfix `<T>` Between the class name and the `::` in all function definition.

```
template <typename T>
class Foo
{
    public:
        void setVal(T a);
        void printVal(void);
    private:
        T m_a;
};
```

```
template <typename T>
void Foo<T>::setVal(T a)
{
    m_a = a;
}
template <typename T>
void Foo<T>::printVal(void)
{
    cout << m_a << "\n";
}
```

STL: Standard Template Library

Easy and efficient implementation

- A collection of pre-written, tested classes provided by C++.
- All built using templates (adaptive with many data types).
- Provide useful data structures
 - `vector(array)`, `set`, `list`, `map`, `stack`, `queue`
- Standard functions:
 - Common ones: `.size()`, `.empty()`
 - For a container that is neither stack or queue: `.insert()`, `.erase()`, `swap()`, `.clear()`
 - For list or vector: `.push_back()`, `.pop_back()`
 - For set or map: `.find()`, `.count()`
 - More on stacks and queues...

STL: Standard Template Library

Notes on vector and list

- You may only use brackets to access existing items in vector. Keep the current size vector in mind especially after `push_back()` and `pop_back()`.
- You cannot access list element by brackets.
- Choose between vector and list:
 - **vectors** are based on dynamic arrays placed in contiguous storage. Fast on access but slow on insertion/deletion.
 - **lists** are the opposite. It offers fast insertion/deletion, but slow access to middle elements.

STL: Standard Template Library

Notes on size and capacity

- Bonus question: Size and capacity of a vector?

```
#include <iostream>
#include <vector>
using namespace std;
int main() {
    vector<int> myVec;
    // insert only one item
    myVec.push_back(999);
    cout << "size:" << myVec.size() << endl;
    cout << "capacity:" << myVec.capacity() << endl;
    // insert 100 items
    for (int i=0; i<100; i++){ myVec.push_back(i); }
    cout << "size:" << myVec.size() << endl;
    cout << "capacity:" << myVec.capacity() << endl;
    cout << "max size:" << myVec.max_size() << endl;
    return 0;
}
```

→ On my computer:

```
size:1
capacity:1
size:101
capacity:128
max size:4611686018427387903
```

STL: Standard Template Library

Implementation example: Iterators

- STL Iterators: Use `.begin()` and `.end()`
 - `.begin()` : return an iterator that points to the first element.
 - `.end()` : return an iterator that points to the ***past-the- last*** element.
- A container as a `const` reference cannot use regular iterator but need to use `const` iterator. Example: `list<string>::const_iterator it;`
- Examples

```
void main()
{
    vector<int>    myVec;
    myVec.push_back(1234);
    myVec.push_back(5);
    myVec.push_back(7);
    vector<int>::iterator it;
    it = myVec.begin();
    while ( it != myVec.end() ){
        cout << (*it);
        it++;
    }
}
```

STL: Standard Template Library

Warning: using iterators for changing vector

- It could be dangerous to use iterator to traverse a vector when we have performed insertion/deletion.
- Safe solution: Reinitialize iterators of a vector whenever its size has been changed.

```
// Guess what is the output?
int main ()
{
    vector<int> v;
    v.push_back(50);
    v.push_back(22);
    v.push_back(10);
    vector<int>::iterator b = v.begin();
    vector<int>::iterator e = v.end();
    for (int i = 0; i < 100; i++) { v.push_back(i); }
    while (b != e) {
        cout << *b++ << endl;
    }
}
```

Standard Template Library

How to use STL? No need to recite all of them!

- Remember the basic provided libraries (such as size, etc)
- Check <http://www.cplusplus.com/reference/stl/> for more details if needed.

STL: Standard Template Library

Some more topics

- More STL examples, such as `map`, `set`, etc.
- More STL algorithms, such as `find()`, `sort()`, etc.

STL

Iterator invalidation

Category	Container	After insertion , are...		After erasure , are...		Conditionally
		iterators valid?	references valid?	iterators valid?	references valid?	
Sequence containers	array	N/A		N/A		
	vector	No		N/A		Insertion changed capacity
		Yes		Yes		Before modified element(s)
		No		No		At or after modified element(s)
	deque	No	Yes	Yes, except erased element(s)		Modified first or last element
			No	No		Modified middle only
	list	Yes		Yes, except erased element(s)		
	forward_list	Yes		Yes, except erased element(s)		
Associative containers	set multiset map multimap	Yes		Yes, except erased element(s)		
Unordered associative containers	unordered_set unordered_multiset unordered_map unordered_multimap	No	Yes	N/A		Insertion caused rehash
		Yes		Yes, except erased element(s)		No rehash

* Smart Pointer

A good tool in modern C++

- A smart pointer is an abstract data type that simulates a pointer while providing added features, such as automatic memory management or bounds checking.
- C++ libraries provide implementations of smart pointers in the form of `unique_ptr`, `shared_ptr` and `weak_ptr`
- Trade-off by using smart pointers: may increase memory usage (for example in `list`)
- More info: [\[Smart pointer tutorial\]](#)

```
// normal pointers
void UseNormalPointer{
    MyClass *ptr = new MyClass();
    ptr->doSomething();
}
// We must delete ptr to avoid memory leak!
```

```
// smart pointers, defined in std
void UseSmartPointer{
    unique_ptr<MyClass> ptr(new MyClass());
    ptr->doSomething();
}
// ptr is deleted automatically here!
// unique_ptr: encapsulated pointer as only data member
```

* Smart Pointer

unique_ptr and shared_ptr

- **unique_ptr**
 - Allows exactly one owner of the underlying pointer.
 - Can be moved to a new owner, but not copied or shared.
 - Small and efficient (the size is one pointer as data member)
 - More about unique_ptr: [\[unique_ptr tutorial\]](#)
- **shared_ptr**
 - Reference-counted smart pointer. Use when you want to assign one raw pointer to multiple owners.
 - The size is two pointers; one for the object and one for the shared control block that contains the reference count.
 - More about shared_ptr: [\[shared_ptr tutorial\]](#)

```
auto ptrA = make_unique<Song>(L"Diana Krall", L"The Look of Love");
```

```
auto ptrB = std::move(ptrA);
```

* Smart Pointer

Try to implement a unique_ptr?

```
template<class T>
class unique_ptr {
public:
    unique_ptr(T* p) : ptr_(p) {}
    ~unique_ptr() {
        delete ptr_;
    }
private:
    T* ptr_;
};
```

Pointers vs Smart Pointers

Example: Container of pointers

Normal Pointers

vector 1

pop_back()

Ooops! (0_o)

Smart Pointers

vector 2

*Inline Functions

Motivation & Examples

- When you define a function as being inline, you ask the compiler to directly embed the function's logic into the calling function (for speed).
- All methods with their body defined directly in the class are inline. Simply add the word inline before the function return type to make an externally defined method inline.
- Inlining is only a request to the compiler, not a command. Compiler can ignore the request for inlining. Compiler may not perform inlining in such circumstances like:
 - Loops, recursion, static variables, etc
- Save time for function call vs large binary executable file?

```
template <typename T>
class Foo
{
public:
    void setVal(T a);
    void printVal(void){cout<<m_a<<endl;}
private:
    T m_a;
};
```

```
inline template <typename T>
void Foo<Item>::setVal(T a)
{
    m_a = a;
}
```

Algorithm Efficiency

Note: Complexity of a program

- Quantify the efficiency of a program.
- The magnitude of time and space cost for an algorithm given certain size of input.
 - Time complexity: quantifies the run time.
 - Space complexity: quantifies the usage of the memory (or sometimes hard disk drives, cloud disk drives, etc.).
- Naturally, the size of input determines how long a program runs.
 - Often, the larger the size of input, the longer the run time. But not always that case.
 - Consider: sort an array of 1,000 items and 1,000,000 items vs get size of an array of 1,000 items and 1,000,000 items
- Big-O notation

Big-O Notation

Formal definition

If you are interested in formal definition, check [here](#).

Well, you can simply understand as how many operations given input size of n regardless of the constant.

No need to memorize definitions. Example: if your program takes,

- about n steps $\rightarrow O(n)$
- about $2n$ steps $\rightarrow O(n)$
- about n^2 steps $\rightarrow O(n^2)$
- about $3n^2+10n$ steps $\rightarrow O(n^2)$
- about 2^n steps $\rightarrow O(2^n)$

Question: What is the speed of growth for typical function?

$$f(n) = \log(n) / n / n^2 / 2^n / n!$$

Big-O Notation

Growth speed

Big-O Arithmetic

How to determine the entire program?

Generally,

- If things happen sequentially, we add Big-Os;
- If one thing happen within another, then we multiply Big-Os.
- Simple rule: Watch the **LOOPS** in your programs!

Rules:

$$O(f(n)) + O(g(n)) = O(\max(f(n), g(n)))$$

$$O(f(n)) \times O(g(n)) = O(f(n) \times g(n))$$

Efficiency Analysis

Example 1: Linear Search

- Linear search: Look for one item in an unsorted array
- Best cases? Average cases? Worst cases?
- What if the array is ordered?

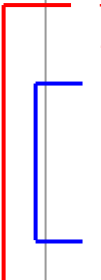

```
int linear_search(array arr, size n, value v)
{
    for (int i=0; i<n; i++)
    {
        if (arr[i] == v)
            return i;
    }
    return -1;
}
```

Efficiency Analysis

Example 2: Enumerate all pairs

- Task: Find all pairs from one array (Note: [1,2] and [2,1] are considered different pairs)

```
int all_pairs(array arr, size n, value v)
{
    for (int i=0; i<n; i++)
    {
        for (int j=0; j<n; j++)
        {
            if (i != j)
                cout << "Pair:" << arr[i] << "and" << arr[j] << endl;
        }
    }
    return -1;
}
```

A diagram illustrating the nested loops in the code. A red bracket on the left side groups the outer loop (the 'for' loop with 'i') and its closing brace. A blue bracket on the left side groups the inner loop (the 'for' loop with 'j') and its closing brace, showing it is nested within the outer loop.

Efficiency Analysis

Example 3: Binary search

- Task: Look for one item in a sorted array

```
// this is pseudo code
int binary_search(array arr, value v, start_index s, end_index e)
{
    if (s > e) return -1
    find the middle point i=(s+e)/2
    if (arr[i] == v) return i
    else if (arr[i] < v) return binary_search(arr, v, i+1, e)
    else return binary_search(arr, v, s, i-1)
}
```

Big-O and Complexity

Big O	Name	n = 128
$O(1)$	constant	1
$O(\log n)$	logarithmic	7
$O(n)$	linear	128
$O(n \log n)$	"n log n"	896
$O(n^2)$	quadratic	16192
$O(n^k), k \geq 1$	polynomial	
$O(2^n)$	exponential	10^{40}
$O(n!)$	factorial	10^{214}

Question: Can you find an algorithms with $O(n!)$ complexity?

Most important algorithm ever!

Methods:

- Selection sort
- Bubble sort
- Insertion sort
- Merge sort
- Quick sort

Focus on:

1. Steps for each sorting algorithm
2. Runtime complexity for worst cases, best cases and average cases
3. Space complexity
4. How about additional assumptions, such as the array is “almost sorted” / “reversed” arrays

Sorting

Selection sort

Steps:

Idea: Find the smallest item in the unsorted portion and place it in the front.

Runtime complexity:

Average: $O(n^2)$

Worst: $O(n^2)$

Best: $O(n^2)$

Space complexity: $O(1)$

Sorting

Insertion sort

Steps:

Idea: Pick one from the unsorted part and place it in the right position.

Runtime complexity:

Average: $O(n^2)$

Worst: $O(n^2)$

Best: $O(n)$

Space complexity: $O(1)$

Sorting

Bubble sort

Steps:

4	3	1	5	2
3	4	1	5	2
3	1	4	5	2
3	1	4	2	5
1	3	2	4	5
1	2	3	4	5

Idea: Well, just “bubble” as its name

Runtime complexity:

Average: $O(n^2)$

Worst: $O(n^2)$

Best: $O(n)$

Space complexity: $O(1)$

Sorting

Merge sort

Steps:

Idea: Divide and conquer

Runtime complexity:

Average: $O(n \log n)$

Worst: $O(n \log n)$

Best: $O(n \log n)$

Space complexity: $O(n)$

Sorting

Quicksort

Idea: Set a pivot. Numbers less than pivot are placed to front while others to end.

Runtime complexity:

Average: $O(n \log n)$

Worst: $O(n^2)$

Best: $O(n \log n)$

Space complexity: $O(\log n)$

Sorting

Other methods and complexity?

- $O(n \log n)$ is faster than $O(n^2)$ → Merge sort is more efficient than selection, insertion and bubble sort in runtime.
- $O(n \log n)$ is best average complexity that a general sorting algorithm can achieve.
- With more information about the data provided, you can sometimes sort things almost linearly.

Question: What is the complexity of these sorting algorithms if you know the array is **reversed**? What if the array is **almost already sorted**?

Sorting

Other methods and complexity?

There are many other sorting methods:

- Shell sort (shell 1959, Knuth 1973, Ciura 2001)
- Quicksort 3-way
- Heap sort
- Bucket sort

Sorting

Why sorting is important?

Sorting is the most important and basic algorithm. Many other real-world problems are somewhat based on sorting, including:

Sorting Algorithms Animations: <https://www.toptal.com/developers/sorting-algorithms>

Other good demos:

<https://www.cs.usfca.edu/~galles/visualization/ComparisonSort.html>

<http://sorting.at/>

Sorting

Variant sorting problems

Question: How about get the *K-th* largest numbers in one array?

[Leetcode question #215](#)

Hint:

1. How to find the k-th largest numbers by merge sort and quicksort (or other sort methods)? What are the average and worst complexity?
2. What data structures is good to use?

Big-O Notation

Big-O Complexity Chart

Array Sorting Algorithms

Algorithm	Time Complexity			Space Complexity
	Best	Average	Worst	Worst
<u>Quicksort</u>	$\Omega(n \log(n))$	$\theta(n \log(n))$	$O(n^2)$	$O(\log(n))$
<u>Mergesort</u>	$\Omega(n \log(n))$	$\theta(n \log(n))$	$O(n \log(n))$	$O(n)$
<u>Timsort</u>	$\Omega(n)$	$\theta(n \log(n))$	$O(n \log(n))$	$O(n)$
<u>Heapsort</u>	$\Omega(n \log(n))$	$\theta(n \log(n))$	$O(n \log(n))$	$O(1)$
<u>Bubble Sort</u>	$\Omega(n)$	$\theta(n^2)$	$O(n^2)$	$O(1)$
<u>Insertion Sort</u>	$\Omega(n)$	$\theta(n^2)$	$O(n^2)$	$O(1)$
<u>Selection Sort</u>	$\Omega(n^2)$	$\theta(n^2)$	$O(n^2)$	$O(1)$
<u>Tree Sort</u>	$\Omega(n \log(n))$	$\theta(n \log(n))$	$O(n^2)$	$O(n)$
<u>Shell Sort</u>	$\Omega(n \log(n))$	$\theta(n(\log(n))^2)$	$O(n(\log(n))^2)$	$O(1)$
<u>Bucket Sort</u>	$\Omega(n+k)$	$\theta(n+k)$	$O(n^2)$	$O(n)$
<u>Radix Sort</u>	$\Omega(nk)$	$\theta(nk)$	$O(nk)$	$O(n+k)$
<u>Counting Sort</u>	$\Omega(n+k)$	$\theta(n+k)$	$O(n+k)$	$O(k)$
<u>Cubesort</u>	$\Omega(n)$	$\theta(n \log(n))$	$O(n \log(n))$	$O(n)$

Hints for Project 3: Kalah

Note & Reminders:

1. Implementation order: All others work fine before implementing **SmartPlayer**.
2. Understand the game tree and carefully design the recursion in **chooseMove()**.
